

A. Current Status and Trends

Observed Warming and its Causes

A.1 Human activities, principally through emissions of greenhouse gases, have unequivocally caused global warming, with global surface temperature reaching 1.1 degrees above 1850-1900 in 2011-2020. Global greenhouse gas emissions have continued to increase, with unequal contributions.

A.1.1 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

A.1.2 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

A.1.3 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

Observed Changes and Impacts

A.2 Widespread and rapid changes in the atmosphere, ocean, cryosphere and biosphere have occurred. Human-caused climate change is already affecting many weather and climate extremes in every region across the globe, with widespread adverse impacts and related losses and damages to nature.

A.2.1 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

A.2.2 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely

Current Progress in Adaptation

A.3 Adaptation planning and implementation has progressed across all sectors and regions, with documented benefits and varying effectiveness. Despite progress, adaptation gaps exist, and will continue to grow at current rates of implementation, and limits have been reached in places.

A.3.1 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

A.3.2 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

A.3.3 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

Current Progress in Mitigation

A.4 Policies and laws addressing mitigation have consistently expanded since the previous assessment. Global greenhouse gas emissions in 2030 implied by nationally determined contributions announced by October 2021 make it likely that warming will exceed 1.5 degrees during this century.

A.4.1 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

A.4.2 Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

B. Notes on Method

This page carries the material a statement pass must leave alone. Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

Key message: the heading path attached to every chunk decides what the retriever sees, because the chunker copies it into the embedded text. A callout in bold is emphasis, not a section of the report.

The listing below is set in a monospaced face at a smaller size. Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

```
def chunk(document):  
  
    for item, level in document.iterate_items():  
  
        yield item.text, level
```

We are the first generation to feel the effect of climate change and the last generation who can do something about it, as the saying goes.

Numbered footnotes follow, in a smaller oblique face. Global surface temperature was 1.09 degrees higher in 2011-2020 than in 1850-1900, with larger increases over land than over the ocean, and the rate of increase in the last fifty years is the fastest in two millennia. The likely range of total human-caused global surface temperature increase over the same period is close to the observed warming, and observed increases in well-mixed greenhouse gas concentrations are unequivocally caused by human activities, from energy use to land-use change.

1 The three Working Group contributions to the Sixth Assessment Report are the physical science basis, impacts and adaptation, and mitigation.

2 The three Special Reports cover global warming of 1.5 degrees, climate change and land, and the ocean and cryosphere in a changing climate.

3 In this report the near term is defined as the period until 2040, and the long term as the period from 2081 to 2100, following the assessment.
